

The results are in!

The paver below on the left was placed in a bath of muriatic acid for five minutes. It emerged with a pitted surface and other signs of material degradation. The paver on the right, manufactured with Infusion™ technology, spent the same amount of time in an equally concentrated bath of the acid. The paver shows little to no surface degradation.

Willow Creek Infusion technology is an advanced manufacturing process that enhances not only the appearance, but also the performance, of Willow Creek Select Series™ pavers. The Select Series includes Willow Creek's Slatestone™, Slatestone Grande™, Eurostone™ and Dekrastone™ paver families.

The Infusion process has proven its reliability through rigorous testing. Pavers manufactured using the Infusion process have been exposed to all four seasons in the Upper Midwest to test for the effects of weathering.

Willow Creek is proud to introduce this innovative manufacturing process to the Midwest.

Specifically, Infusion technology:

- Enhances paver color and extends the life of the paver's bright, vibrant "new paver" look
- Improves stain resistance for everyday use
- Reduces absorption, making the paver more durable

Infusion technology enhances a paver's durability and extends the life of any paved surface, from patios and driveways to courtyards and pool decks. See for yourself the difference that the Infusion process makes.
